5.5 ELECTRONIC RELEASES

5.5.2 Version S2 - Adjustment of I_r, T_r, I_{sd}, T_{sd}

LCD display with navigation and setting buttons, indication led, battery case and USB port.

Long delay protection against overloads with an adjustable threshold bases on the RMS value of the current:

- I_r = 0.4 ÷ 1 I_n (steps 1A)
- T_r = 3 - 15s (3 - 5 - 10 - 15 3^{MEM} - 5^{MEM} - 10^{MEM} - 15^{MEM}) (8 steps) (*)

Short delay protection against short-circuits with an adjustable I_{sd} threshold:

- I_{sd} = 1.5 - 2 - 2.5 - 3 - 4 - 5 - 6 - 7 - 8 - 9 - 10 x I_r (11 steps)
- T_{sd} = 0 - 100ms - 200ms - 300ms - 400 ms - 500 ms (I = K)
- T_{sd} = 0 - 100ms - 200ms - 300ms - 400 ms - 500 ms (I²t = K) (**)

Instantaneous protection with fixed threshold I_{sf} = 3kA

Residual current against earth

Measure of ground fault:

- I_{Δn} : 30mA - 300mA - 1A - 3A (4 steps)
- Δt : 0s - 300ms - 1s - 3s (4 steps)

(*) @ 6 I_r

General remarks on protection unit

The protection units S2/Sg are normally supplied by the current transformers (CTs) and the internal voltage supply.

When the current flowing through the circuit breaker is lower than 12% of the maximum power (20% of I_n for single phase load) the internal voltage supply assures the following basic functions of protection unit: RCD protection, LED status, display indication (without backlight) and RCD diagnostic trip test (T button).

Instead, over the 12% of the maximum power (20% of I_n for single phase load), the additional power provided by current transformers ensures the complete functions of the protection unit, included diagnostic functions (e.g. trip test). Display backlight and integrated measure (if available) are instead guaranteed starting from 20% of the maximum power (35% of I_n for single phase load), in absence of any other supply. In any case the external power supply is strongly recommended for the correct working of measurement, as well as RS485 communication.

To ensure the same performance when the load is less than 12% of the maximum power (20% of I_n for single phase load) to grant complete functions, one of the following optional power supplies can be used:

- external Auxiliary power supplier or, alternatively, Modbus communication interface;
- power supply temporarily connected to frontal USB socket, connected to a 5V DC power bank or PC

Together with above protections, activated in case of electric faults, the trip unit also integrates self-protection for:

- Over temperature : in case the internal temperature of protection unit exceed 95°C;
- Auto diagnostics: in case embedded watchdog circuit detects internal malfunctions, which could compromise the correct working of microcontroller.
